

## TRANSPORT HUB COUNTER-FLOW

### DNA-Tracker® - CF Analyser®

**DNA-Tracker's Counter-Flow Analyser** is a cost-effective, hardware and software solution, which identifies device **movement patterns** that are contrary to the normal behaviour pattern for a particular setting.

For example: - The normal behaviour pattern at a passenger terminal is for individuals to move steadily towards the boat, aeroplane or train they are catching. *If a device is moving against that normal flow pattern, or failing to make progress, then that behaviour may need to be investigated?*

The system produces a 'Counter-Flow Alert', processes captured data in real-time, displays the relevant information, (device ID codes, triangulated position, dates, times and counter-flow duration), onto control room screens, or via laptops for temporary deployments.

DNA-Tracker therefore delivers the capability to investigate and intervene rapidly, allowing control room staff, CCTV operators and officers on the ground to work in an efficient, coordinated manner.
